

WAHAB GIWA

Professional Profile, Academic Record, Skills, Leadership, Milestones & Career Roadmap

COMPUTER SCIENCE • SOFTWARE ENGINEERING • AI • DATA •
TECHNOLOGY LEADERSHIP

Prepared	11 September 2026
Current academic context	Computer Science undergraduate
Institution	Emmanuel Alayande University of Education (EAUED), Oyo
Professional direction	Software Engineering + AI Engineering + Data/Database Engineering
Technology initiative	Dinamic Technology
Community leadership	EAUED Tech Community

Document note: This profile is compiled from information shared across conversations. It intentionally distinguishes confirmed details from goals, interests, and plans. It should be updated as new achievements, certifications, projects, and employment experience are added.

1. Executive Profile

Wahab Giwa is a Computer Science undergraduate at Emmanuel Alayande University of Education (EAUED), Oyo, with a strong interest in software engineering, artificial intelligence, data, databases, product development, and technology community leadership. His development path combines hands-on web/backend engineering with an expanding focus on AI-powered products and data-driven systems.

His stated long-term ambition is to become an exceptionally strong and highly employable software engineer and AI expert, with a profile spanning AI engineering, machine learning, prompt engineering, AI application integration, full-stack development, and data/database engineering.

Beyond technical learning, he has taken visible leadership responsibilities within student technology communities, including pioneering leadership in NACOS at EAUED and more recent leadership of the EAUED Tech Community.

He is also building an entrepreneurial technology-services direction under the name Dinamic Technology, with planned offerings around UI kits, data analysis solutions, web development, and full-stack AI development.

Professional identity

Core identity	Computer Science student, technology builder, community leader, aspiring AI/software engineer
Primary technical direction	Full-stack software engineering and AI product engineering
Secondary direction	Data analysis, databases, data engineering foundations
Entrepreneurial direction	Technology services, UI kits, software products, AI applications
Leadership direction	Student/community technology leadership and ecosystem building

2. Personal Information

Name used in drafts	Wahab Tomiwa Giwa / Giwa Wahab
Preferred short name in communications	Wahab
Age previously stated	24
Country context	Nigeria
Institution	Emmanuel Alayande University of Education (EAUED), Oyo
Field of study	Computer Science
Current stage	Undergraduate; 300-level context has been stated

Privacy note: This document deliberately does not include sensitive credentials, account numbers, passwords, private security information, or precise residential location. Contact details can be added separately if desired.

3. Academic Profile

Wahab is studying Computer Science at Emmanuel Alayande University of Education (EAUED), Oyo. He has described himself as part of the pioneering university cohort following the institution's transition from Emmanuel Alayande College of Education.

Programme	Computer Science
Institution	Emmanuel Alayande University of Education, Oyo
Academic level referenced	300 level
Academic performance mentioned	CGPA of 4.74 was previously stated
Academic goal	Strong grades / A-level performance and First Class trajectory

Academic subjects and technical areas discussed

- Data Structures and Algorithms
- Operating Systems and Banker's Algorithm
- Database Management Systems and MySQL
- Computer Programming
- Computer Networks / web technologies
- Data analysis and Power BI
- Software engineering and backend development

Academic/project learning style

- Prefers explanations that are simple, direct, and practical.
- Often wants detailed explanations first, followed by concise exam-ready wording.
- Learns strongly through implementation, debugging, projects, and practical examples.
- Has repeatedly connected academic learning with employability, portfolio development, and real-world products.

4. Technical Skills & Technology Exposure

The following represents technologies and technical areas the user has discussed, practiced, or identified as learning targets. Proficiency varies; the list should not be interpreted as certification of mastery.

Frontend

- HTML — advanced level previously self-assessed
- CSS — advanced level previously self-assessed
- Sass
- Bootstrap — basic exposure
- Tailwind CSS — basic exposure
- JavaScript — intermediate exposure
- TypeScript — basic/current learning exposure
- React
- Next.js
- React Hooks and TanStack Query
- UI/UX design and UI kit creation

Backend & APIs

- Python — advanced-beginner level previously stated
- FastAPI
- Pydantic
- Starlette / ASGI concepts
- Node.js
- Express / JavaScript backend concepts
- PHP
- Laravel
- Django / Flask — learning/exploration
- NestJS — learning/exploration
- REST APIs
- WebSockets / Socket.IO
- Authentication: JWT, Bearer tokens, OAuth2 password flow, social login concepts

Databases & data

- PostgreSQL
- MySQL
- MongoDB / Mongoose
- SQLAlchemy
- Alembic migrations
- Database testing strategies
- Excel
- Power BI and DAX
- Data analysis

AI / emerging engineering

- Third-party AI API integration
- AI model integration into applications
- Prompt engineering
- AI application integration
- Generative AI
- Agentic AI
- PydanticAI
- RAG / LangChain / MCP / LangGraph / CrewAI — areas of exploration
- Machine learning / AI engineering as a long-term specialization

Dev tools, testing & infrastructure exposure

- Git/GitHub-style software workflow concepts
- PyCharm and Python virtual environments
- pytest and FastAPI TestClient
- Dependency overrides for testing
- Docker
- Kubernetes — learning/exploration
- AWS/cloud concepts — interest and research

5. Projects, Build Experience & Practical Work

FastAPI full-stack application

A major recent learning project has involved building a FastAPI-based application with authentication, database access, CRUD-style functionality, templates/frontend interaction, testing, and deployment preparation. Topics encountered include JWT authentication, OAuth2PasswordRequestForm, SQLAlchemy, Alembic, PostgreSQL/SQLite testing, dependency overrides, pytest, TestClient, Jinja templates, aiofiles, and frontend-to-backend HTTP methods.

The project has also involved practical debugging of issues such as 404 responses, 405 Method Not Allowed errors, test database behavior, fixture data, route methods, and deployment. As of the latest stated status, one examination paper remained and the app had not yet been deployed.

Waste-management AI concept

Wahab has explored an AI waste-image-recognition hackathon concept titled around a Waste Management Control System for Oyo State markets. The idea connects computer vision/AI with practical public-sector waste-management problems.

Natours / Node & MongoDB exposure

He has worked through a Node/Mongoose project context and encountered MongoDB Atlas connectivity/time-out issues while also working with a local MongoDB installation.

UI/UX portfolio

He has an existing UI/UX portfolio and has identified UI/UX services and UI kit sales as an early monetization opportunity because these assets are more mature than some of his software/data portfolio work.

6. Leadership, Community & Service

NACOS — EAUED

Wahab has described himself as the pioneering NACOS president/chairman for the Computer Science department at EAUED, serving for approximately two and a half sessions before transitioning leadership to another person.

His activities included engaging with wider NACOS leadership, including efforts to connect EAUED NACOS with the national/community network and Southwest coordination.

Computer Science Departmental Day

He was involved in the first Computer Science Departmental Day at EAUED, held on 6 August 2026 at Twin Hall, Faculty of Science. The event used the presidential message/theme “BUILDING THE FUTURE TOGETHER.” He worked on communications involving the Dean/Student Affairs, Faculty Officer, HOD, lecturers, guest speaker, supporters, and executives.

Recognition

At a departmental event, he reported receiving two recognitions: an Outstanding Student award and an Award of Service connected with his service as pioneering NACOS president.

EAUED Tech Community

More recently, Wahab has served as President of the EAUED Tech Community. He has worked on volunteer engagement, community organization, skills-acquisition initiatives, webinars, and member participation.

Community programmes and communications

- Skills-acquisition planning covering Web Development, Graphics Design, and Data Analysis.
- Data Analysis training coordination involving Olamide, Aminah, and Giwa Wahab.
- Web Development coordination involving Akinjole Abass, Ridwan Olaitan, and Giwa Wahab.
- Technology webinar planning around how technology is shaping future careers.

- Volunteer continuation/dedication form planning to identify members ready to contribute consistently.

7. Major Milestones

Milestone	Significance
Academic progression	Progressed through Computer Science undergraduate study at EAUED, with 300-level context referenced.
Strong academic standing	Reported a CGPA of 4.74 at one point in the academic journey.
Technical foundation	Built substantial exposure across frontend, backend, databases, data analysis, APIs, and AI.
Pioneering NACOS leadership	Served as pioneering NACOS president/chairman for the Computer Science department.
Community recognition	Received Outstanding Student and Award of Service recognition.
Departmental event leadership	Contributed to organizing the first Computer Science Departmental Day at EAUED.
EAUED Tech Community	Moved into a broader technology-community leadership role as President.
Entrepreneurship	Started developing Dinamic Technology as a technology-services brand.
AI direction	Progressively shifted from general web development toward full-stack AI / AI product engineering.
Backend engineering	Built and debugged a serious FastAPI application involving authentication, databases, migrations, testing and frontend integration.
Monetization focus	Explored UI kits, freelance services, data-analysis work, software products, and AI applications as income channels.

8. Entrepreneurship — Dinamic Technology

Dinamic Technology is the technology-services brand Wahab has been developing. The strategy is to launch service lines progressively while also offering selected services on a freelance basis.

Planned/current service direction

- UI kits / UI resources
- Data analysis solution work
- Web development
- Full-stack AI development
- Longer-term exploration: AI, digital marketing, cloud computing and broader software services

Strategic reasoning

UI/UX is a natural early entry point because Wahab already has UI/UX portfolio work. Software engineering and data projects are being developed in parallel to strengthen the technical portfolio before expanding the service offering.

Product and monetization interests

- Selling UI kits online
- Building SaaS products
- Creating AI applications that ordinary users may pay for
- Remote junior data-analyst opportunities
- Combining freelance services with scalable digital products

9. Career Direction & Long-Term Vision

The strongest recurring career theme is becoming a high-level software engineer who can design, build, deploy, and monetize AI-powered products—not merely consume AI tools.

Target professional profile

- Full-Stack AI Engineer / AI Product Engineer
- Software Engineer with strong AI integration capability
- AI Engineer / Machine Learning Engineer
- Prompt Engineering and AI application integration
- Database/data engineering foundations
- Data analyst capability as an additional income/employability track

Desired outcome

The stated ambition is to become “unignorable” in software engineering and AI, with enough depth to compete for strong opportunities and enough practical ability to build products independently.

10. Current Learning Priorities

- Strengthen Python and FastAPI beyond tutorial-level knowledge.
- Complete and deploy the current FastAPI application.
- Deepen SQL, PostgreSQL, database design, SQLAlchemy and migrations.
- Improve TypeScript and modern React/Next.js engineering.
- Build production-quality APIs and authentication systems.
- Learn Docker and practical deployment workflows.
- Develop a strong portfolio of real software/data/AI projects.
- Move from basic AI API usage into reliable AI product architecture.
- Learn RAG, agents and AI orchestration only after solid software/API foundations.
- Develop data-analysis employability through Excel, SQL, Power BI and Python.
- Turn the strongest portfolio assets into paid services/products through Dinamic Technology.

11. Observed Strengths

- Strong curiosity across multiple technical domains.
- Willingness to debug difficult implementation problems rather than avoid them.
- Leadership experience at student/community level.
- Entrepreneurial orientation and interest in monetizing technical skills.
- Ability to connect technical learning with real-world problems.
- Interest in both product design and engineering, creating potential for end-to-end product development.
- High ambition and a clear desire to build a differentiated technology career.

12. Development Challenges & Risks to Manage

- Breadth can become a distraction if too many frameworks are learned simultaneously.
- Deployment and production completion should follow learning/building quickly; unfinished projects reduce portfolio value.
- AI frameworks should not replace fundamentals in Python, APIs, databases, testing, system design and software engineering.
- Leadership/community responsibilities need to be balanced against deep technical practice.
- Monetization efforts should be narrowed to a small number of offers rather than many simultaneous business lines.
- Consistency is more important than repeatedly restarting roadmaps.

13. Selected Timeline

Period	Record
2025	Reported technical baseline across HTML/CSS, JavaScript, React/Node, PHP/Laravel, Python/Postgres/WebSocket and related tools.
2026 — early	Worked on EAUED/NACOS activities, orientation communications, skills initiatives and technology-community programming.
2026 — mid	Expanded focus into FastAPI, SQLAlchemy, authentication, testing, AI integration, data analysis and modern frontend/backend development.
6 Aug 2026	Participated in the first Computer Science Departmental Day at EAUED and associated communications/leadership activities.
2026 — later	Reported departmental recognition with Outstanding Student and Award of Service awards.
Sep 2026	Serving as President of EAUED Tech Community; one exam paper remained at the latest update; current app deployment was still pending.

14. Working & Communication Preferences

- Prefers simple, straightforward explanations before advanced detail.
- Likes practical, implementation-focused guidance.
- Often requests concise, human-sounding versions of formal communications.
- Values professional presentation for school, community, leadership and business communications.
- Responds well to structured roadmaps, checklists, milestones and concrete next actions.

15. Information Not Yet Established in the Available Record

To keep this profile accurate rather than inventing facts, the following details have not been established sufficiently and are intentionally left out:

- Exact date of birth
- Home/residential address
- Phone number and email address
- Complete education history before EAUED

- Official transcript / complete semester-by-semester CGPA record
- Formal employment history
- Professional certifications and certificate numbers
- Complete GitHub/portfolio/LinkedIn URLs
- Exact dates for every leadership appointment
- Complete list of software projects with live URLs
- Exact revenue, clients, contracts or business financial performance

16. Recommended Next Milestones

- 1. Deploy the current FastAPI application and document it as a portfolio project.
- 2. Publish a clean GitHub repository/readme and live demo where appropriate.
- 3. Build 2–3 production-style full-stack applications rather than many unfinished tutorials.
- 4. Build at least one serious AI product demonstrating authentication, database persistence, AI integration and deployment.
- 5. Build one polished data-analysis portfolio project using SQL + Power BI + Python.
- 6. Package Dinamic Technology's UI/UX offering and begin validating paid demand.
- 7. Create a clear personal portfolio positioning around Full-Stack AI / Software Engineering.
- 8. Develop a focused 6–12 month learning plan with measurable deliverables instead of collecting frameworks.
- 9. Continue community leadership while deliberately protecting consistent deep-work time for engineering.

17. Personal Positioning Statement

“A Computer Science builder and technology leader developing the ability to design, engineer, deploy, and grow modern software and AI-powered products—while creating practical technology opportunities for others.”

18. Closing Profile

Wahab's journey shows a transition from learning broad web-development technologies toward a more integrated engineering identity: software engineering + AI + data + product thinking + technology leadership. The next major stage is execution—finishing and deploying projects, developing a small number of deep technical competencies, building public proof of ability, and converting the strongest skills into opportunities and revenue.

The most important near-term principle is simple: **finish, deploy, document, demonstrate, and repeat.**
